Problem Definition

- Tasked with providing a preliminary design of a thrust chamber capable of producing 2000 pounds of thrust at a specific impulse of 278 seconds and a chamber pressure of 500 psi.
- Must have a cooling system that can replace the ablative cooling used currently
- Design an injector that will replace the current showerhead design.
- Thrust chamber should be able to fit inside current rocket housing.
- Each component must be well-documented with justification to the design choices
Objectives

- Conceptualize and design an injector that can thoroughly mix the fuel and oxidizer to ensure stable combustion while also being relatively simple to manufacture.
- Determine combustion chamber dimensions to achieve given chamber pressure and guarantee complete combustion of the propellants.
- Calculate nozzle geometries to achieve the given thrust and exit pressure.
- Design a cooling system that is capable of keeping the combustion chamber and nozzle within safe operating temperatures.
- Select materials for each component that are capable of handling the high pressures and temperatures while also remaining lightweight and cost-effective.
Injector

- **Purpose:** mix the fuel and oxidizer to provide a stable combustion
- **Requirements:**
  - Compatible to handle LOX and LCH4
  - LOX and LCH4 flow rate of between 5 to 5.3 and 1.85 to 2 lbm/s
  - Incorporate cooling system design
  - Withstand a temperature of 1200 F and pressure of 500 psi
  - Resultant spray in axial direction
Injector

- **Selection:**
  - Impinging element - unlike-doublet

- **Parameters:**
  - Impingement angle: 60°
  - Immediate spray angle: 9°
  - Orifice diameters:
    - LOX: 0.069 in.
    - LCH4: 0.052 in.
    - Film cooling: 0.039 in.
  - Injector face diameter: 4 in.

- **Material:**
  - Inconel 718
Combustion Chamber

- **Purpose:** Provide adequate volume for complete combustion and direct flow to the nozzle with minimal pressure losses.

- **Requirements:**
  - Maintain a chamber pressure of 500 psi during combustion.
  - Maintain structural integrity for temperatures up to 1200 Rankine (5460 Fahrenheit) with cooling.
  - Remain as lightweight as possible to minimize engine mass.
  - Material should be resistant to thermal shock and corrosion.
Combustion Chamber

- Material Selection
  - Inconel 718, a nickel based super alloy, was selected.
  - Yield stress at 1200 Fahrenheit: 142-152 ksi
  - Good corrosion and thermal shock resistance
  - Relatively lightweight: .296 pound per cubic inch
  - Good thermal conductivity

- Relevant dimensions
  - Wall thickness: .063 inches
  - Chamber volume: 70 cubic inches
  - Chamber diameter: 4 inches
  - Chamber cylindrical length: 4.53 inches (down from ~13 inches of current Rocket Project engine due to improved injector design)
## Nozzle

<table>
<thead>
<tr>
<th>Needs</th>
<th>Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Small Size</td>
<td>Hold Temperature up to ~5600 R</td>
</tr>
<tr>
<td>Low Cost &amp; Great Performance on Material</td>
<td>Weight under 0.5 lb</td>
</tr>
<tr>
<td>Feasible Design with other parts</td>
<td>Wall Thickness around 0.06 in</td>
</tr>
<tr>
<td>Easy Machinability and Fabrication</td>
<td>Withstand 500 Psi of Pressure</td>
</tr>
</tbody>
</table>

### Concerns:

**Nozzle type**: Conical Nozzle

- Fit with the small rocket engine but moderate efficiency

**Nozzle material**: Pyrolytic Graphite

- Great overall properties but one nozzle per launch (may alter the flow geometry)
- Relatively poor erosion resistance
Nozzle

Properties of Pyrolytic Graphite:

- Withstand temperature over 5000 F
- Low density of 0.079±0.001 lb/in^3
- Good durability, wear resistance, and strength
- Good thermal conductivity and thermal expansion

Parameters:

- Wall thickness: 0.063 in
- Nozzle length: 6.52 in
- Contour Angle: 15 degree
- Throat diameter: 1.82 in
- Exit diameter: 4.61 in

Four section views of the nozzle (front, left, top, and trimetric)
Cooling System

Heat transfer is important in rocket design:

- The thrust chamber must be cooled in order to withstand imposed loads and stresses
- Requires a lot progress from other design components

General idea of steady-state cooling methods

- Extreme temperatures of 5900 Rankine in thrust chamber
- A liquid is meant to absorb the heat being created before being expelled from the rocket
Cooling System Design: LFFC + Regenerative

- thin film of fuel in combustion chamber wall: thermal barrier between combustion gases and the combustion chamber
- Hot gas wall cooling by flowing coolant through copper liners

- Previous designs: Thor, Jupiter, Atlas, H-1, J-2
- Pros: lightweight, efficient, good for long durations, good for larger engine
- Cons: degrades engine performance
Combustion Chamber Cooling Jacket

Cooling Jacket made of 2 parts

- **Stainless Steel 501**
  - Thermal Cond. 32.45 W/m*K
  - 8 coolant channels
  - 8 holes to allow coolant flow in/out
  - 0.5” thick

- **Copper Alloy C18150**
  - Thermal Cond. 323.64 W/m*K
  - Solid with no channels
  - Meant for Heat Transfer
  - 0.25” thick
Liquid Fuel Film Cooling: a CFD Analysis

- In the realm of film cooling, the majority of research efforts are directed towards gas turbine engines.

- A conjugate heat transfer problem occurs: heat flux from the film (fluid) to the wall (solid) is of main interest.

- At this fluid/solid interface the heat flux conducted by the fluid must balance out with the heat flux conducted by the solid and any radiation (if not neglected) as shown:

\[
\left(k \frac{\partial T}{\partial y}\right)_{\text{fluid}} + q''_{\text{rad}} = \left(k \frac{\partial T}{\partial y}\right)_{\text{solid}}
\]

Goal: remove \(~3500\) Rankine of heat
Remaining Questions and Recommendations

Questions:

- Is additive manufacturing possible for some of these components? (i.e. combustion chamber, nozzle, injector and/or solid steel cooling jacket)

Recommendations:

- Figuring out what type of tubing, flexible or rigid, will be used to transport coolant from tanks to cooling jacket and from cooling jacket to injector.
- Determine flange attachment points to connect the combustion chamber to the nozzle.
- Continued study on heat distributions for cooling jacket
